

CANOVA.SYS™ – System Overview

A Stewardship-Backed Framework for a Stronger, More Sustainable Canada

Purpose

CANOVA.SYS™ is a Canadian-developed framework that rewards measurable environmental stewardship through local, tradable value. It complements the dollar economy by recognising the worth of caring for the land, water, and ecosystems that sustain communities.

Each verified act of restoration or sustainability generates value that circulates within a local network. As participants earn, exchange, and reinvest CANOVA, the same resources that sustain Canada are renewed through community action and measurable impact.

National Relevance

Canada's greatest wealth lies in its natural resources. Yet environmental care rarely generates direct, traceable value for those who protect or restore it. CANOVA provides a framework that recognises and rewards those efforts in a measurable way.

The system enables individuals, landowners, businesses, and institutions to participate directly in the cycle of environmental value:

- **Earn** CANOVA for measurable stewardship contributions.
- **Exchange** CANOVA within their community network.
- **Reinvest** CANOVA in future environmental actions.
- **Renew** the cycle through continued participation and shared responsibility.

Through this process, environmental restoration becomes a living part of the local economy, creating both ecological and social benefit.

What Makes CANOVA.SYS™ Unique

Stewardship-Backed and Measurable

Each unit of CANOVA is anchored to verified actions and measurable outcomes. Value enters the system only when stewardship occurs, ensuring every unit represents tangible environmental benefit.

Local Circulation with National Connectivity

CANOVA begins through community networks that operate locally while connecting to a unified national framework. As the system expands, participants will be able to earn CANOVA in one region and exchange it anywhere across the network, creating a seamless flow of environmental value throughout Canada. Each local action strengthens the national framework, and every exchange supports ongoing restoration.

Inclusive and Participatory

Participation is open to individuals, farmers, businesses, non-profits, and Indigenous nations. CANOVA recognises environmental contribution in all forms, including tree planting, water restoration, habitat protection, sustainable production, and innovation.

Transparent and Accountable

Each verified activity and exchange is recorded, building a transparent dataset that contributes to Canada's broader understanding of environmental progress and resilience.

System Flow

1. **Earn** – Verified stewardship activities generate CANOVA credits.
2. **Exchange** – Credits move through local and regional networks of vendors, organisations, and institutions.
3. **Reinvest** – Participants and businesses use CANOVA to fund future environmental improvement projects such as native planting, soil restoration, or material support for stewardship programs.
4. **Renew** – The process continues, creating a cycle where environmental care generates enduring community value.

This self-sustaining cycle functions as a stewardship-backed secondary economy that strengthens Canada's existing economic systems.

Local and National Alignment

At the local level, CANOVA demonstrates how environmental value can sustain itself through visible community projects. At the national level, the same framework can support:

- Federal sustainability and carbon reduction goals.
- Recognition incentives for companies and landowners achieving measurable impact.
- Transparent environmental data that supports national reporting and accountability.

As CANOVA becomes nationally connected, earned value can be exchanged between communities, creating a cohesive Canadian network of stewardship and shared prosperity. Over time, verified participation could align with federal sustainability programs, offering recognition credits, funding access, or potential tax benefits tied to measurable environmental outcomes.

Why It Matters Now

CANOVA provides a practical and forward-looking approach to link environmental recovery with economic resilience. It offers a way for communities, institutions, and individuals to see direct benefit from the work of regeneration.

The pilot work in Waterloo Region will provide visible, measurable proof of how environmental value can circulate, renew itself, and strengthen both local and national sustainability efforts.
